

## Gas Pressure

<http://ed.ted.com/lessons/how-heavy-is-air-dan-quinn>

Pressure – force exerted on an area

3 main unit of pressure

- Pa = pascals  
1000 Pa = 1 kPa
- atm = atmospheres
- mm Hg = millimeters of mercury  
mm Hg is equal to a unit called the torr  
1 mm Hg = 1 torr

<http://ed.ted.com/lessons/the-history-of-the-barometer-and-how-it-works-asaf-bar-yosef>

mm of Hg

- Evangelista Torricelli accidentally discovered a way to measure atmospheric pressure.
- He had setup a glass tube filled with mercury inverted in a tub of mercury
- If gas pressure changed, the amount of mercury in the glass tube changed.

$$1 \text{ atm} = 760 \text{ mm Hg}$$

At Sea Level

Increase in Pressure

Decrease in Pressure

## Converting Between Units of Pressure

$$101.325 \text{ kPa} = 1 \text{ atm}$$

$$760 \text{ mm Hg} = 1 \text{ atm}$$

$$760 \text{ mm Hg} = 101.325 \text{ kPa}$$

To convert between units it is a simple matter of cross multiplying and dividing

Ex. Convert 745.0 mm Hg into kPa

$$\underline{745.0 \text{ mm Hg}} \times \left[ \frac{101.325 \text{ kPa}}{760 \text{ mm Hg}} \right] = 99.33 \text{ kPa}$$

Try These:

$$99.0 \text{ kPa} = \underline{743} \text{ mm Hg}$$

$$700 \text{ mm Hg} = \underline{93.3} \text{ kPa}$$

$$\cancel{99.0 \text{ kPa}} \times \left[ \frac{760 \cancel{\text{ mm Hg}}}{101.325 \cancel{\text{ kPa}}} \right] \quad 700 \text{ mm Hg} \times \left[ \frac{101.325 \text{ kPa}}{760 \text{ mm Hg}} \right]$$

$$720 \text{ mm Hg} = \underline{0.947} \text{ atm}$$

$$1.43 \text{ atm} = \underline{145} \text{ kPa}$$

$$720 \text{ mm Hg} \times \left[ \frac{1 \text{ atm}}{760 \text{ mm Hg}} \right] \quad 1.43 \text{ atm} \times \left[ \frac{101.325 \text{ kPa}}{1 \text{ atm}} \right]$$

**Atmospheric pressure** – force exerted by the mass of air above a certain point

Low pressure areas have less atmospheric mass above their location

High pressure areas have more atmospheric mass above their location

as elevation increases, there is less overlying atmospheric mass, so that pressure decreases with increasing elevation

## Temperature Conversions

- Kelvin scale also called absolute temp scale
- Absolute zero or 0 K is equal to  $-273^{\circ}\text{C}$
- This is the lowest possible temperature
- The temp at which all particle motion stops

$$\text{K} = ^{\circ}\text{C} + 273$$

$$^{\circ}\text{C} = \text{K} - 273$$

Try These:

$$10.0^{\circ}\text{C} = \underline{283.0} \text{ K}$$

$$373 \text{ K} = \underline{100}^{\circ}\text{C}$$

$$25^{\circ}\text{C} = \underline{298} \text{ K}$$

## Practice Sheet 1

Abbreviations	Conversions
atm - atmosphere mm Hg - millimetres of mercury torr - same as mm Hg	$1 \text{ atm} = 101.325 \text{ kPa} = 760 \text{ mm Hg} = 760 \text{ torr}$

Use cross multiplying and dividing to find out the required units

1. Convert the following pressures to kilopascals:

a. 700 mm Hg

$$700 \text{ mm Hg} \times \left[ \frac{101.325 \text{ kPa}}{760 \text{ mm Hg}} \right] = 93.3 \text{ kPa}$$

e. 1.20 atm

$$1.20 \text{ atm} \times \left[ \frac{101.325 \text{ kPa}}{1 \text{ atm}} \right] = 122 \text{ kPa}$$

b. 850 mm Hg

$$113 \text{ kPa}$$

f. 3.45 atm

$$350 \text{ kPa}$$

2. Convert the following pressures to mm Hg:

a. 100 kPa

$$100 \text{ kPa} \times \left[ \frac{760 \text{ mm Hg}}{101.325 \text{ kPa}} \right] = 750 \text{ mm Hg}$$

e. 150 torr

$$150 \text{ mm Hg}$$

b. 75.0 kPa

$$563 \text{ mm Hg}$$

f. 2.3 atm

$$1.7 \times 10^3 \text{ mm Hg}$$

3. Convert the following pressures to atm:

a. 850 mm Hg

$$1.12 \text{ atm}$$

e. 300 kPa

$$2.96 \text{ atm}$$

b. 75 kPa

$$0.74 \text{ atm}$$

f. 545 mm Hg

$$0.717 \text{ atm}$$

4. Convert the following temperatures:

a.  $45.5 \text{ }^\circ\text{C} = 318.5 \text{ K}$

$$45.5 + 273$$

b.  $755 \text{ K} = 482 \text{ }^\circ\text{C}$

$$755 - 273$$

c.  $73.5 \text{ K} = -199.5 \text{ }^\circ\text{C}$

d.  $100 \text{ }^\circ\text{C} = 373 \text{ K}$

If you measured the air pressure in Vancouver and then again at the top of Mount Everest, would there be a difference in air pressure? Why or why not?

Assume that the atmospheric pressure increases from 750 mm Hg to 765 mm Hg. Sketch the initial and final views of a mercury barometer.

Imagine that you had two aerosol cans, both filled with the same amounts of the same gas. You heat one of the cans up, while keeping the other at room temperature. Will both cans have the same gas pressure? Why or why not? Explain your answer!

Imagine that you are pushing down the plunger of a syringe. However, the syringe is plugged (no air can escape). When you push down with the plunger, you are compressing the gas in the syringe. What happens to the gas pressure when you do this? Explain your answer!
